

## Selena Wells Dev Roadmap

**AJAX** - I can use a dataset of my skills to populate the skills using AJAX on the skills second of my page.

**Gallery** - I will have a hover state that puts an overlay on the “tile” and a title pops up with a description of what that portfolio piece is and how it was made with.

On click → show gallery (overlay the gallery on top of everything else)- use GOT project last year as reference of how to do this.

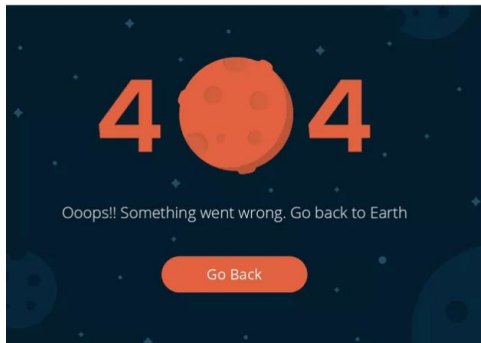

**Accordion Resume** - Hide show the resume experience by clicking the title and it folds out to show more content

Logic- on click show extra content using js. Maybe the content will be grabbed using ajax? The info will “unfold” and push the other button below it down.

Follow this tutorial to create an accordion :D

**Error Handling** - I want to do something fun like this

1. Make the error page
2. Create a .htaccess file
3. Wire it up to the error page
4. Test it out

This link seems helpful on how to actually code and set up the error handling.
